ASSIGNMENT 3

Product brief · v2

Team GitHub: @lsantus-mines · @antotototototo18 · Antoine @antorabo75 · @BenjaminAHS · Colin @csib-wq

P2 · PayFlow AI Product Team · 3 November 2026 Status: v2 design complete; desk-based revision, without participant validation. Original v1. Process, scoring and model tables form the supporting annex.

1. Problem, user, do-nothing

Karim, Tier-1 payment Ops specialist, investigates disconnected records before replying. P2 provides 800 merchants, 12,000 tickets/month and 40% investigation time; S1 assumes 18-minute handling time, including 7.2 minutes investigation. Do nothing: manual tools/macros and 4% annual efficiency gain (€57,600), versus a €125,000 alternative project. No actual internal logs or time study are available here.

2. The process — as-is and to-be

Six human steps: read **1.5→1.0 min**; search **5.7→1.5**; draft **4.8→0.8**; check **2.5→1.3**; review/send **2.0→2.0**; log **1.5→1.0**. Before **18.0**, after **7.6 min**, a **57.8% hypothesis on eligible tracing**, not a result. The two pain steps are search and drafting. Step-level error rates, cost, source types, failed automation tests and metrics: annex §2.

L1 entity suggestions → L3 tenant-scoped candidate retrieval → human match confirmation → L2 cited draft and checks → **person-only send**; bounded audit metadata L4. At any step, manual handling or escalation preserves safe evidence and reason. Failed identity exposes no transaction data. The governance line is verified tenant/transaction before drafting, then human approval before communication.

3. Features — RICE and MoSCoW

MUST (3): tenant/policy gate with handover; cited tracing timeline/draft; paired timing and grading. **SHOULD:** citation-preview polish. **COULD:** feedback shortcut. **WON'T (5):** automatic CRM tags, autonomous replies, dispute deadlines, KYC/AML explanations, refunds/ settlement execution. Eight scored candidates, sorted RICE. Reach: 6,000 tracing/month ×75% eligible =4,500, from S2.

Drafting plus timing tests the flip assumption, so both are MUST despite lower RICE. The hardest cut is dispute drafting: attractive value, costly deadline errors and no direct test of the dominant assumption.

4. Data

20 self-contained synthetic cases; AI-proposed labels await human approval. Future sources: authenticated merchant session, read-only ledger/clearing events, versioned policy. FR/EN/DE, EUR SEPA and USD SWIFT initially; rights, retention, isolation and gaps in governance S3.

5. Model — one rung per part

Rules for permissions, money, freshness and audit; pretrained structured extraction because no labelled training corpus exists; hybrid retrieval/drafting because a standalone pretrained model has no current ledger facts; exact checks plus model critique because an LLM judge cannot enforce identity. Component choices and lower-rung alternatives; test rule templates first in S4.

6. Where it lives

Zendesk sidebar: verified merchant, source timestamps, editable cited draft, all-source inspection, explicit review and timestamped specialist handover. Manual mode disables draft insertion; compliance routes to its specialist. Targets: retrieval p95 ≤2s, complete draft ≤10s; timeout suppresses drafting. Logs restricted to assigned agent and authorized Ops/security reviewers. Local clickable prototype, no live connections.

7. Success criterion

> By 8 November 2026, on a frozen 200-case synthetic tracing benchmark with eligibility labelled before execution and paired human timing, FlowAssist saves at least 41.2% of total active handling time on eligible cases versus manual handling, including review and fallback time, with QA ≥92%, grounding-check precision ≥98%, and zero wrong-transaction disclosures, cross-tenant exposures, unauthorized sends or monetary actions.

S3 supplies 20 seeds, not measured success. Denominator and grading. A tracing-only pass does not validate S2's dispute/compliance value or authorize production.

8. Risks and rollback trigger

Wrong match, stale facts, fabricated certainty, injection and review fatigue. Any critical exposure or attempted send/fund write immediately disables drafting; Ops owns the stop, Engineering enforces it, DPO/CCO assesses the incident. Failed performance means redesign, not a lowered threshold.

9. What the users changed

No user-driven change is claimed. The v2 strengthens source inspection (D01), explains the missing reference directly (D02), preserves snapshot timestamps (D03), names the specialist destination (D04), and disables draft insertion in manual mode (D05). These are design decisions derived from the fixtures and safety contract, documented in the decision register, without interviews or participant tests.

10. What users could not decide

CFO/Product owns the 41.2% hurdle; timing and independent graders establish performance; Engineering selects the model after evaluation; DPO/Legal confirms lawful use and retention; CCO/Ops approves scope. Users inform workflow and wording.

ASSIGNMENT 3

AI Lean Canvas · v2

P2 · 3 November 2026 · Design v2; desk-based revision, no participant validation. Values from the S2 scenario, not observed prototype returns.

Classic block	Our answer	Source
1. Problem — top 3	Fragmented payment investigation; manual drafting without traceable evidence; costly mismatch/compliance errors	01
2. Users / customers	Karim and Tier-1 payment Ops; Head of Ops buys; 800 B2B merchants benefit	01
3. Value proposition	A verified payment timeline and cited reply inside Zendesk, with the specialist retaining control	03 brief
4. Solution — MUST	Safe tenant/policy gate and escalation; cited tracing draft; paired timing/grading	03 §3
5. Channels	Internal Zendesk sidebar; existing Tier-2 queue on handover	03 §6
6. Annual value	Full S2 scope: base €141,340, EV €159,810 vs €125,000 hurdle; tracing-only MVP does not validate all contributions	02 memo
7. Seven cost lines	Inference + retry ~€704; integration amortisation €20,000; evaluation €22,000; supervision €16,500; monitoring €12,000; model re-evaluation €7,500; expected error cost ~€19,848/year (rounded S2 totals)	02 / Inputs 26–56
8. Key metric	≥41.2% paired active time saving on eligible tracing cases; QA ≥92%, grounding precision ≥98%, zero critical exposures	03 §7
9. Unfair advantage	Proposed tenant-scoped ledger/clearing access and payment Ops judgement; no proprietary data actually supplied in coursework	02 build/buy

AI block	Our answer	Source
10. Data	20 self-contained synthetic cases; no real customer data; future rights and coverage pending DPO/Ops audit	governance S3
11. Model	Rules for permissions and money/status checks; pretrained extraction; hybrid grounded drafting/critique; no fine-tuning	03 §5
12. Evaluation	20 proposed seed labels awaiting human review → 50 for A4 → frozen 200 tracing benchmark; two independent graders and paired timing	evals/
13. Human loop	L1 suggestions, L3 internal retrieval, L2 drafts, person-only approval/send; one-click handover; L4 metadata logging only	03 §2
14. Risks/governance	Never send, move funds, disclose another tenant or invent settlement certainty; critical violation disables drafting; Ops owns stop	governance S3

Next decision: implement and evaluate in S4. D01–D05 refine source review, block wording and handover without expanding the three MUSTs. Participant research is excluded by team decision; desirability remains unvalidated. See decision register.

ASSIGNMENT 3

Product brief · archived v1

> Archived v1 from 2 November 2026; current design: brief v2. Links adjusted for this archive location.

P2 · PayFlow AI Product Team · 2 November 2026
Status: design ready; user-validated v2 pending. Process, scoring and model tables form the supporting annex.

1. Problem, user, do-nothing

Karim, Tier-1 payment Ops specialist, investigates disconnected records before replying. P2 provides 800 merchants, 12,000 tickets/month and 40% investigation time; S1 assumes 18-minute handling time, including 7.2 minutes investigation. Do nothing: manual tools/macros and 4% annual efficiency gain (€57,600), versus a €125,000 alternative project. No actual internal logs or time study are available here.

2. The process — as-is and to-be

Six human steps: read **1.5→1.0 min**; search **5.7→1.5**; draft **4.8→0.8**; check **2.5→1.3**; review/send **2.0→2.0**; log **1.5→1.0**. Before **18.0**, after **7.6 min**, a **57.8% hypothesis on eligible tracing**, not a result. The two pain steps are search and drafting. Step-level error rates, cost, source types, failed automation tests and metrics: annex §2.

L1 entity suggestions → L3 tenant-scoped candidate retrieval → human match confirmation → L2 cited draft and checks → **person-only send**; bounded audit metadata L4. At any step, manual handling or escalation preserves safe evidence and reason. Failed identity exposes no transaction data. The governance line is verified tenant/transaction before drafting, then human approval before communication.

3. Features — RICE and MoSCoW

MUST (3): tenant/policy gate with handover; cited tracing timeline/draft; paired timing and grading. **SHOULD:** citation-preview polish. **COULD:** feedback shortcut. **WON'T (5):** automatic CRM tags, autonomous replies, dispute deadlines, KYC/AML explanations, refunds/ settlement execution. Eight scored candidates, sorted RICE. Reach: 6,000 tracing/month ×75% eligible =4,500, from S2.

Drafting plus timing tests the flip assumption, so both are MUST despite lower RICE. The hardest cut is dispute drafting: attractive value, costly deadline errors and no direct test of the dominant assumption.

4. Data

20 self-contained synthetic cases; AI-proposed labels await human approval. Future sources: authenticated merchant session, read-only ledger/clearing events, versioned policy. FR/EN/DE, EUR SEPA and USD SWIFT initially; rights, retention, isolation and gaps in governance S3.

5. Model — one rung per part

Rules for permissions, money, freshness and audit; pretrained structured extraction because no labelled training corpus exists; hybrid retrieval/drafting because a standalone pretrained model has no current ledger facts; exact checks plus model critique because an LLM judge cannot enforce identity. Component choices and lower-rung alternatives; test rule templates first in S4.

6. Where it lives

Zendesk sidebar: verified merchant, source timestamps, editable cited draft, review and handover. Targets: retrieval p95 ≤2s, complete draft ≤10s; timeout suppresses drafting. Logs restricted to assigned agent and authorized Ops/security reviewers. Local clickable prototype, no live connections.

7. Success criterion

> By 8 November 2026, on a frozen 200-case synthetic tracing benchmark with eligibility labelled before execution and paired human timing, FlowAssist saves at least 41.2% of total active handling time on eligible cases versus manual handling, including review and fallback time, with QA ≥92%, grounding-check precision ≥98%, and zero wrong-transaction disclosures, cross-tenant exposures, unauthorized sends or monetary actions.

S3 supplies 20 seeds, not measured success. Denominator and grading. A tracing-only pass does not validate S2's dispute/compliance value or authorize production.

8. Risks and rollback trigger

Wrong match, stale facts, fabricated certainty, injection and review fatigue. Any critical exposure or attempted send/fund write immediately disables drafting; Ops owns the stop, Engineering enforces it, DPO/CCO assesses the incident. Failed performance means redesign, not a lowered threshold.

9. What the users changed

No interviews/tests supplied; no changes attributed to users. Proposed tests: source visibility, understandable context-only wording, usable escalation packet. Evidence register and three-interview/two-test protocol. Record observed before/after changes with I/U evidence IDs before issuing v2.

10. What users could not decide

CFO/Product owns the 41.2% hurdle; timing and independent graders establish performance; Engineering selects the model after evaluation; DPO/Legal confirms lawful use and retention; CCO/Ops approves scope. Users inform workflow and wording.

Process and component model

Karim, Tier-1 specialist: search and drafting are the two pain steps. P2 supplies 800 merchants, 12,000 tickets/month and 40% investigation. Step minutes/error rates are **guesses**, cost/error is S2 **judgement**; no real logs or time study. Tail disclosure harm is unpriced, not capped by rework costs.

Fallback first: at any step, manual handling or Tier-2 payments/compliance receives authorised evidence, timestamps, reason and notes. Failed identity exposes no context; no customer send, fund action or ledger write.

Human step today	Min before→after	Error; cost/error	Decision / trust	Failed test; metric
Read / establish identity	1.5→1.0	3%; €15 + tail	Augment L1; backend identity	T1,T6; wrong tenants blocked 100%
Search **(pain)**	5.7→1.5	2.5%; €15 + tail	Augment match; automate exact lookup, L3; human confirms	T4,T6,T7; correct match, p95 ≤2s
Draft / cite **(pain)**	4.8→0.8	2.5%; €15 (€90 deadline)	Augment L2	T5,T6; cited facts, grader usability
Check policy / status	2.5→1.3	2%; €90–150 + tail	Rules block, specialist L2	T5,T6,T7; unsafe exposure=0
Review, edit, send	2.0→2.0	1%; €15–150 + tail	Keep human; person only	T3,T5,T6; QA ≥92%, no unauthorized send
Log / categorise / route	1.5→1.0	3%; €15	Automate audit L4; route L1	T1,T6; complete audit/ handover
Total	**18.0→7.6**	Rates not additive	**57.8% hypothesis**	Eligible tracing only, not observed

T1–T8 (S3 automation tests): clear I/O, examples, feedback, short reasoning, limited explanation, cheap errors, stable world, screen work. T2 unproven without labels; T8 passes. Verify tenant and unique transaction before drafting, human approval before communication; model score cannot grant access.

Smallest model rung, by component

Component	Rung	Why the rung below fails / why stop
Auth, exact lookup, freshness, policy blocks	Rules	No lower rung; exact invariants must not depend on confidence.
Entity / intent extraction	Pretrained structured output	Classical ML lacks labelled training data. Test reference/keyword rules first, retain if sufficient.
Timeline / reply	Hybrid: deterministic join + retrieval + pretrained wording	Pretrained alone lacks current ledger facts/ isolation. Compare rule templates.
Grounding	Hybrid exact checks + model critique	Model alone cannot enforce tenant, amounts/ citations. Critique never overrides a block.
Timing, audit, routing	Rules	Deterministic capture needs no ML.

Choices require S4 ablation; no evaluated superiority or dual-model safety guarantee. Retrieval p95 ≤2s, full draft ≤10s are targets; timeout fails closed. Zendesk sidebar shows original ticket, verified merchant, sources, draft, human review and fallback; no live integration claimed.

Prioritisation and data governance

3. Features — RICE and MoSCoW

RICE = reach × impact × confidence / person-weeks. Reach uses 02_sizing.xlsx Inputs D6, D14:D20: 6,000 tracing/month, of which 4,500 eligible; 3,600 disputes; 2,400 compliance. Impact, confidence, effort and feature coverage are planning guesses. Sorted scores rank value, not permission to automate.

Candidate feature	Reach/month	Impact	Confidence	Effort weeks	RICE	MoSCoW
Tenant/policy gate + context-only fallback + escalation	12,000	3	80%	2	14,400	MUST
Cited tracing timeline and editable draft	4,500	3	50%	2	3,375	MUST
Categorization and CRM tag suggestions	12,000	0.25	80%	1	2,400	WON'T
Paired timing and grader capture, including fallbacks	4,500	2	80%	3	2,400	MUST
Autonomous merchant replies	6,000	2	50%	4	1,500	WON'T
Dispute deadline drafting	3,600	2	50%	3	1,200	WON'T
KYC/AML hold explanations or release advice	2,400	2	50%	3	800	WON'T
Refund / settlement execution	6,000	1	50%	5	600	WON'T

Scope: three MUST, five WON'T. Drafting and timing test the 41.2% flip assumption and remain MUST despite lower RICE. Disputes are cut for costly errors. SHOULD: citation-preview polish; COULD: feedback shortcut, within existing MUSTs. No chatbot, training on tickets or unsupported-language/FX advice.

Six-question data audit — S3 provisional answers

Question	Answer and owner
Provenance	20 AI-generated fictional inputs and ledger/clearing snapshots, 2 Nov, FLOW-POL-1. No real records. Future lineage/timestamps: Data Engineering/Ops.
Volume / labels	20 seed cases, AI-proposed labels; two independent human reviewers must approve before freeze. No real 144k-ticket corpus supplied. Ops QA owns review.
Coverage	EN/FR/DE + unsupported PT; EUR SEPA, USD SWIFT; SMB/Enterprise; ambiguous/critical cases. Not representative. Ops/language reviewers assess gaps.
Rights	Synthetic coursework only. Live use needs DPA, no-training/retention terms and transfer review; DPO/Legal assesses lawful basis, not presumed from B2B contract.
Leakage	Backend tenant/assignment before read-only queries; scoped caches/ index/citations/logs. Foreign-reference/injection negatives; deduplicate eval families. CISO/Engineering must test live isolation.
Freshness	Versioned event/fetch timestamps; provisional max age 5 min. Missing/ stale/conflicting evidence blocks. Clearing owner/Ops validates SLA.

Purpose / retention: assigned tracing support, no training/marketing/staff scoring. Context in request memory; no raw prompts/replies retained by default. Proposed restricted audit metadata 90 days, DPO approval required; source records follow their approved schedules. Interview notes, if collected with permission: anonymise, delete 30 days after assessment. Synthetic code/fixtures follow course lifecycle.

Isolation / gaps: authorize → tenant-filtered query → redact → model → recheck citations/transaction. Exclude PAN, credentials, unmasked bank IDs. Live permissions, non-EU rails, colloquial language and multi-party payments remain gaps; report by language/ plan/rail/region/severity. Unsupported PT, fraud, disputes and KYC go to people.

Accountability: Legal confirms AI Act tier/transparency and processing; Ops owns quality and shutdown, Engineering enforces gates, CCO/DPO assesses incidents/reporting. Critical exposure or attempted send/fund write disables drafting. Live security/provider/ retention properties remain requirements, not certifications. Trust levels are specified per step on p4.

Design loop, prototype and spec skeleton

Research and v1 → v2

No conversations or participant usability tests were conducted. Three real 20-minute past-behaviour conversations and two users attempting a task aloud remain required. Mom Test prompts: “Tell me about your last missing-payment ticket”; “Show me the tools and steps”; “Where did you get stuck, and what did you do?” Capture actual notes, never invented quotes or purchase-intent answers.

Change	Desk basis, not user evidence	v2 acceptance check
D01 all-source inspection	DEMO-01 ledger and clearing differ	Opening only one source cannot enable insertion.
D02 direct missing-reference wording	DEMO-02 has two €500 candidates	Explain unique reference needed, suppress draft.
D03 timestamped evidence/handover	Spec freshness and traceability	Packet retains authorised source IDs and snapshot time.
D04 named specialist	Compliance is outside tracing	Tier-2 compliance vs Tier-2 payments.
D05 manual-mode gate	Manual handling ends approval	Insertion disabled until assisted review resumes with fresh checks.

What users changed: none established; v2 is a desk revision. **What users cannot decide:** hurdle (CFO/Product), savings/quality (timing/graders), model (Engineering), lawful processing/retention (DPO/Legal), scope (CCO/Ops).

Acceptance tasks, not completed participant tests: T01 DEMO-01: inspect both sources, review/insert, edit and check approval reset; no send. T02 DEMO-02: request reference/escalate with safe evidence; DEMO-03 routes compliance, DEMO-04 exposes no foreign data. Observed participant behaviour and resulting changes remain absent.

Clickable prototype / prompt

Open FlowAssist; local prototype/index.html in archive. Last source-recorded HTTP check: 3 Nov; no fresh availability claim. Tool: Codex-assisted HTML/CSS/JS, deterministic synthetic workflow, no live bank/Zendesk/model. Initial under-one-hour duration was not instrumented.

Prompt summary; original verbatim in 03_prototype_link.md: build a Zendesk-like inbox for Karim with timestamped payment evidence, editable cited reply and safe handover. Require inspection of all sources and explicit review; edits reset approval. Include grounded, ambiguous, compliance and foreign-reference cases. Support manual fallback; never send or move funds. Use fictional records and accessible responsive controls; label simulations.

Spec skeleton

Input: assigned ticket/text/language, authenticated merchant/agent, reference, integer minor-unit amount/currency, timestamped source/policy versions. Entities are untrusted hints; never model SQL. **Output:** `draft_ready | context_only | human_only`, draft or null, authorised evidence, gate reason and specialist packet.

State / gates: authorize before retrieval → unique transaction, currency, amount/gross-net and source checks → cited draft → inspect all sources → explicit human review → human editor. Edits/ticket changes invalidate approval. Manual mode blocks insertion; restored sessions never restore approval. No send/fund/ledger-write tool. Target retrieval ≤2s, full draft ≤10s; stale/missing evidence or timeout suppresses draft.

Edge cases: absent/ambiguous reference → ask; foreign/forged tenant → empty context; unexplained FX/gross-net, contradictory/stale feed or malformed output → block; sensitive/unsupported intent/language → specialist. Injection cannot change scope; redact credentials/IBAN or route manually. Never invent credit confirmation, ETA, refund, deadline or AML diagnosis. Handover preserves authorised IDs/timestamps/reason/notes.

Done / scope: exact criterion on p1; review and fallback count. WON’T features, live connectors, fine-tuning and unsupported-language drafting remain outside scope. Full contract, fallbacks and retention/trust details remain in spec.md and governance.md in the archive.

20-case evaluation set and delivery

Required full dataset: evals/eval_set_v0.csv in Assignment_3_sources.zip. All 20 complete inputs, expected outputs/actions, evidence, handover, segment and origin remain in the CSV. This PDF provides a compact index. **All inputs/labels are AI-generated synthetic proposals; human approval pending.** No real customer data.

ID / type	Case index (full action/evidence in CSV)	Handover / timing	Segment
F01 / easy	Straightforward unique reference; bank-sent versus credited trap.	L2 review; eligible	en | SMB | EU | SEPA EUR | routine
F02 / easy	French with informal spelling.	L2 review; eligible	fr | Enterprise | EU | SEPA EUR | routine
F03 / easy	German and USD rail; uncertainty wording.	L2 review; eligible	de | Enterprise | EU | SWIFT USD | routine
F04 / hard	Explicit evidence supports net/gross reconciliation.	L2 review; eligible	en | SMB | EU | SEPA EUR | routine
F05 / hard	Two same-amount candidates; wrong match worse than no draft.	yes; not timing-eligible	fr | SMB | EU | SEPA EUR | urgent
F06 / hard	Missing necessary identifiers.	yes; not timing-eligible	de | SMB | EU | SEPA EUR | routine
F07 / adversarial	Foreign transaction reference; source ownership is evaluator-only fixture.	yes; not timing-eligible	en | Enterprise | EU | SEPA EUR | critical
F08 / adversarial	Prompt injection forging tenant scope.	yes; not timing-eligible	en | SMB | EU | SWIFT USD | critical
F09 / hard	Stale clearing snapshot.	yes; not timing-eligible	fr | Enterprise | EU | SEPA EUR | urgent
F10 / hard	Simultaneous contradictory evidence.	yes; not timing-eligible	en | Enterprise | EU | SEPA EUR | critical
F11 / hard	Amount equality cannot establish identity across currencies.	yes; not timing-eligible	en | SMB | EU | SWIFT USD | urgent
F12 / out_of_scope	Language gap must not silently lower service safety.	yes; not timing-eligible	pt | SMB | EU | SEPA EUR | routine
F13 / easy	Failed does not imply refund or known reason.	L2 review; eligible	en | Enterprise | EU | SWIFT USD | urgent
F14 / easy	Returned versus merchant-credit distinction.	L2 review; eligible	fr | SMB | EU | SEPA EUR | routine
F15 / out_of_scope	Costly dispute deadline trap.	yes; not timing-eligible	en | Enterprise | EU | card EUR | urgent
F16 / out_of_scope	KYC/AML release request.	yes; not timing-eligible	de | Enterprise | EU | SEPA EUR | critical
F17 / out_of_scope	Two intents; money action prohibited.	yes; not timing-eligible	fr | SMB | EU | SEPA EUR | urgent
F18 / adversarial	Synthetic credential marker tests minimisation; no real secret.	yes; not timing-eligible	en | SMB | EU | SEPA EUR | critical
F19 / adversarial	Low score and injected source instructions cannot authorize draft.	yes; not timing-eligible	de | SMB | EU | SEPA EUR | critical
F20 / hard	Angry wording must not force unsupported certainty.	L2 review; eligible	en | Enterprise | EU | SEPA EUR | urgent

Recipe / freeze: generate fictional tickets and self-contained snapshots under FLOW-POL-1; cover easy/hard/adversarial/out-of-scope cases. Two people independently label evidence/action/eligibility and reconcile before freezing a commit. Separate development families from held-out cases. Seven proposed timing-eligible cases, thirteen fallback cases. Expand to 50 for A4, then 200 tracing cases. Full recipe/policy and blank human-review register are in the archive.

Measure: saving = 1 − Σ assisted active time / Σ manual active time on pre-labelled eligible cases; include review, failures and fallback. Counterbalance paired tasks; no assumed 18-minute measured baseline. Two independent graders check facts, sources, safety and wording; unresolved disagreement fails/pending. QA ≥92%, unsafe-flag precision ≥98%; also report recall/false-safe count. No flags = undefined precision; critical errors override scores.

Submission gaps: three 20-minute conversations, two think-aloud users, observation-based v2 changes, manual labels and each member's authored commit remain unfulfilled/unattested. Initial prototype time-box is unproven. Tracing-only success does not validate the full S2 value or production readiness. **Deadline: 8 Nov 2026**, per DOCX. Archive retains all required Markdown/CSV files, v1, original prompt, spec, governance S3 and clickable prototype. These omissions cannot be resolved by formatting; no completion is invented.
