ASSIGNMENT 3

Product brief · v2

Team GitHub: @lsantus-mines · @antotototototo18 · Antoine @antorabo75 · @BenjaminAHS · Colin @csib-wq

P2 · PayFlow AI Product Team · 3 November 2026 Status: v2 design complete; desk-based revision, without participant validation. Original v1. Process, scoring and model tables form the supporting annex.

1. Problem, user, do-nothing

Karim, Tier-1 payment Ops specialist, investigates disconnected records before replying. P2 provides 800 merchants, 12,000 tickets/month and 40% investigation time; S1 assumes 18-minute handling time, including 7.2 minutes investigation. Do nothing: manual tools/macros and 4% annual efficiency gain (€57,600), versus a €125,000 alternative project. No actual internal logs or time study are available here.

2. The process — as-is and to-be

Six human steps: read **1.5→1.0 min**; search **5.7→1.5**; draft **4.8→0.8**; check **2.5→1.3**; review/send **2.0→2.0**; log **1.5→1.0**. Before **18.0**, after **7.6 min**, a **57.8% hypothesis on eligible tracing**, not a result. The two pain steps are search and drafting. Step-level error rates, cost, source types, failed automation tests and metrics: annex §2.

L1 entity suggestions → L3 tenant-scoped candidate retrieval → human match confirmation → L2 cited draft and checks → **person-only send**; bounded audit metadata L4. At any step, manual handling or escalation preserves safe evidence and reason. Failed identity exposes no transaction data. The governance line is verified tenant/transaction before drafting, then human approval before communication.

3. Features — RICE and MoSCoW

MUST (3): tenant/policy gate with handover; cited tracing timeline/draft; paired timing and grading. **SHOULD:** citation-preview polish. **COULD:** feedback shortcut. **WON'T (5):** automatic CRM tags, autonomous replies, dispute deadlines, KYC/AML explanations, refunds/ settlement execution. Eight scored candidates, sorted RICE. Reach: 6,000 tracing/month ×75% eligible =4,500, from S2.

Drafting plus timing tests the flip assumption, so both are MUST despite lower RICE. The hardest cut is dispute drafting: attractive value, costly deadline errors and no direct test of the dominant assumption.

4. Data

20 self-contained synthetic cases; AI-proposed labels await human approval. Future sources: authenticated merchant session, read-only ledger/clearing events, versioned policy. FR/EN/DE, EUR SEPA and USD SWIFT initially; rights, retention, isolation and gaps in governance S3.

5. Model — one rung per part

Rules for permissions, money, freshness and audit; pretrained structured extraction because no labelled training corpus exists; hybrid retrieval/drafting because a standalone pretrained model has no current ledger facts; exact checks plus model critique because an LLM judge cannot enforce identity. Component choices and lower-rung alternatives; test rule templates first in S4.

6. Where it lives

Zendesk sidebar: verified merchant, source timestamps, editable cited draft, all-source inspection, explicit review and timestamped specialist handover. Manual mode disables draft insertion; compliance routes to its specialist. Targets: retrieval p95 ≤2s, complete draft ≤10s; timeout suppresses drafting. Logs restricted to assigned agent and authorized Ops/security reviewers. Local clickable prototype, no live connections.

7. Success criterion

> By 8 November 2026, on a frozen 200-case synthetic tracing benchmark with eligibility labelled before execution and paired human timing, FlowAssist saves at least 41.2% of total active handling time on eligible cases versus manual handling, including review and fallback time, with QA ≥92%, grounding-check precision ≥98%, and zero wrong-transaction disclosures, cross-tenant exposures, unauthorized sends or monetary actions.

S3 supplies 20 seeds, not measured success. Denominator and grading. A tracing-only pass does not validate S2's dispute/compliance value or authorize production.

8. Risks and rollback trigger

Wrong match, stale facts, fabricated certainty, injection and review fatigue. Any critical exposure or attempted send/fund write immediately disables drafting; Ops owns the stop, Engineering enforces it, DPO/CCO assesses the incident. Failed performance means redesign, not a lowered threshold.

9. What the users changed

No user-driven change is claimed. The v2 strengthens source inspection (D01), explains the missing reference directly (D02), preserves snapshot timestamps (D03), names the specialist destination (D04), and disables draft insertion in manual mode (D05). These are design decisions derived from the fixtures and safety contract, documented in the decision register, without interviews or participant tests.

10. What users could not decide

CFO/Product owns the 41.2% hurdle; timing and independent graders establish performance; Engineering selects the model after evaluation; DPO/Legal confirms lawful use and retention; CCO/Ops approves scope. Users inform workflow and wording.

ASSIGNMENT 3

AI Lean Canvas · v2

P2 · 3 November 2026 · Design v2; desk-based revision, no participant validation. Values from the S2 scenario, not observed prototype returns.

Classic block	Our answer	Source
1. Problem — top 3	Fragmented payment investigation; manual drafting without traceable evidence; costly mismatch/compliance errors	01
2. Users / customers	Karim and Tier-1 payment Ops; Head of Ops buys; 800 B2B merchants benefit	01
3. Value proposition	A verified payment timeline and cited reply inside Zendesk, with the specialist retaining control	03 brief
4. Solution — MUST	Safe tenant/policy gate and escalation; cited tracing draft; paired timing/grading	03 §3
5. Channels	Internal Zendesk sidebar; existing Tier-2 queue on handover	03 §6
6. Annual value	Full S2 scope: base €141,340, EV €159,810 vs €125,000 hurdle; tracing-only MVP does not validate all contributions	02 memo
7. Seven cost lines	Inference + retry ~€704; integration amortisation €20,000; evaluation €22,000; supervision €16,500; monitoring €12,000; model re-evaluation €7,500; expected error cost ~€19,848/year (rounded S2 totals)	02 / Inputs 26–56
8. Key metric	≥41.2% paired active time saving on eligible tracing cases; QA ≥92%, grounding precision ≥98%, zero critical exposures	03 §7
9. Unfair advantage	Proposed tenant-scoped ledger/clearing access and payment Ops judgement; no proprietary data actually supplied in coursework	02 build/buy

AI block	Our answer	Source
10. Data	20 self-contained synthetic cases; no real customer data; future rights and coverage pending DPO/Ops audit	governance S3
11. Model	Rules for permissions and money/status checks; pretrained extraction; hybrid grounded drafting/critique; no fine-tuning	03 §5
12. Evaluation	20 proposed seed labels awaiting human review → 50 for A4 → frozen 200 tracing benchmark; two independent graders and paired timing	evals/
13. Human loop	L1 suggestions, L3 internal retrieval, L2 drafts, person-only approval/send; one-click handover; L4 metadata logging only	03 §2
14. Risks/governance	Never send, move funds, disclose another tenant or invent settlement certainty; critical violation disables drafting; Ops owns stop	governance S3

Next decision: implement and evaluate in S4. D01–D05 refine source review, block wording and handover without expanding the three MUSTs. Participant research is excluded by team decision; desirability remains unvalidated. See decision register.

ASSIGNMENT 3

Product brief · archived v1

> Archived v1 from 2 November 2026; current design: brief v2. Links adjusted for this archive location.

P2 · PayFlow AI Product Team · 2 November 2026
Status: design ready; user-validated v2 pending. Process, scoring and model tables form the supporting annex.

1. Problem, user, do-nothing

Karim, Tier-1 payment Ops specialist, investigates disconnected records before replying. P2 provides 800 merchants, 12,000 tickets/month and 40% investigation time; S1 assumes 18-minute handling time, including 7.2 minutes investigation. Do nothing: manual tools/macros and 4% annual efficiency gain (€57,600), versus a €125,000 alternative project. No actual internal logs or time study are available here.

2. The process — as-is and to-be

Six human steps: read **1.5→1.0 min**; search **5.7→1.5**; draft **4.8→0.8**; check **2.5→1.3**; review/send **2.0→2.0**; log **1.5→1.0**. Before **18.0**, after **7.6 min**, a **57.8% hypothesis on eligible tracing**, not a result. The two pain steps are search and drafting. Step-level error rates, cost, source types, failed automation tests and metrics: annex §2.

L1 entity suggestions → L3 tenant-scoped candidate retrieval → human match confirmation → L2 cited draft and checks → **person-only send**; bounded audit metadata L4. At any step, manual handling or escalation preserves safe evidence and reason. Failed identity exposes no transaction data. The governance line is verified tenant/transaction before drafting, then human approval before communication.

3. Features — RICE and MoSCoW

MUST (3): tenant/policy gate with handover; cited tracing timeline/draft; paired timing and grading. **SHOULD:** citation-preview polish. **COULD:** feedback shortcut. **WON'T (5):** automatic CRM tags, autonomous replies, dispute deadlines, KYC/AML explanations, refunds/ settlement execution. Eight scored candidates, sorted RICE. Reach: 6,000 tracing/month ×75% eligible =4,500, from S2.

Drafting plus timing tests the flip assumption, so both are MUST despite lower RICE. The hardest cut is dispute drafting: attractive value, costly deadline errors and no direct test of the dominant assumption.

4. Data

20 self-contained synthetic cases; AI-proposed labels await human approval. Future sources: authenticated merchant session, read-only ledger/clearing events, versioned policy. FR/EN/DE, EUR SEPA and USD SWIFT initially; rights, retention, isolation and gaps in governance S3.

5. Model — one rung per part

Rules for permissions, money, freshness and audit; pretrained structured extraction because no labelled training corpus exists; hybrid retrieval/drafting because a standalone pretrained model has no current ledger facts; exact checks plus model critique because an LLM judge cannot enforce identity. Component choices and lower-rung alternatives; test rule templates first in S4.

6. Where it lives

Zendesk sidebar: verified merchant, source timestamps, editable cited draft, review and handover. Targets: retrieval p95 ≤2s, complete draft ≤10s; timeout suppresses drafting. Logs restricted to assigned agent and authorized Ops/security reviewers. Local clickable prototype, no live connections.

7. Success criterion

> By 8 November 2026, on a frozen 200-case synthetic tracing benchmark with eligibility labelled before execution and paired human timing, FlowAssist saves at least 41.2% of total active handling time on eligible cases versus manual handling, including review and fallback time, with QA ≥92%, grounding-check precision ≥98%, and zero wrong-transaction disclosures, cross-tenant exposures, unauthorized sends or monetary actions.

S3 supplies 20 seeds, not measured success. Denominator and grading. A tracing-only pass does not validate S2's dispute/compliance value or authorize production.

8. Risks and rollback trigger

Wrong match, stale facts, fabricated certainty, injection and review fatigue. Any critical exposure or attempted send/fund write immediately disables drafting; Ops owns the stop, Engineering enforces it, DPO/CCO assesses the incident. Failed performance means redesign, not a lowered threshold.

9. What the users changed

No interviews/tests supplied; no changes attributed to users. Proposed tests: source visibility, understandable context-only wording, usable escalation packet. Evidence register and three-interview/two-test protocol. Record observed before/after changes with I/U evidence IDs before issuing v2.

10. What users could not decide

CFO/Product owns the 41.2% hurdle; timing and independent graders establish performance; Engineering selects the model after evaluation; DPO/Legal confirms lawful use and retention; CCO/Ops approves scope. Users inform workflow and wording.

Process, features and component model

2. Process — as-is → to-be

Fallback first: at every step, “Escalate with context” preserves the ticket, safe evidence, block reason and agent notes for Tier-2. A failed identity check exposes no transaction context. Agents can dismiss the copilot and continue manually. No customer message or financial write is available to the copilot.

Minutes are **active human time**, including review. All step splits, error rates and after-times below are **guesses**, retaining S1's 18-minute total; validate with paired timing. Error costs are S2 judgement (€15 tracing; €90 dispute; €150 compliance), not measured incident rates. Rates are step-specific, not additive.

#	Step; today: Tier-1 specialist	Before min	Error rate (guess)	Cost/error	Decision; failed S3 test	Trust	After min (guess)	Step metric
1	Read ticket, establish merchant and intent	1.5	3% wrong/ missing reference	€15; disclosure tail unpriced	Augment; T1 unclear input, T6 expensive identity error	L1 suggests; identity verified by backend	1.0	Wrong-tenant attempts blocked: 100%
2	Search ledger and clearing logs **(pain)**	5.7	2.5% wrong match	€15; disclosure tail unpriced	Augment matching; automate exact read-only lookup only; T4 multi-source chain, T6, T7 live status	L3 internal candidate retrieval, human confirms match	1.5	Unique correct match; lookup latency p95 ≤2s target
3	Write reply and attach sources **(pain)**	4.8	2.5% unsupported claim	€15; €90 if deadline invented	Augment; T5 explanation, T6 cost	L2 draft, approval required	0.8	Cited factual claims; two-grader usability
4	Check status, policy and constraints	2.5	2% missed restriction	€90–150; tail unpriced	Augment; T5, T6, T7 changing rules	Rules block automatically; specialist L2 validation	1.3	Unsafe drafts exposed: 0
5	Review, edit, approve and send	2.0	1% residual wrong answer	€15–150; tail unpriced	Keep human; T3 delayed reopen feedback, T5, T6	Person only	2.0	QA ≥92%; unauthorized sends: 0
6	Categorize, log and hand over if needed	1.5	3% wrong routing	€15 rework	Automate event logging, augment routing; T1 ambiguous intent, T6 urgent cases	L4 append-only metadata; L1 route suggestion	1.0	Complete audit events; handover delivery
	Total	**18.0**					**7.6**	**57.8% hypothesized saving**

T1–T8 refer to S3 slide 14: clear I/O, examples, feedback, short reasoning, limited explanation, cheap errors, stable world, screen work. T2 is unproven without a labelled corpus; T8 passes. The 7.6-minute target is for eligible tracing cases, not all tickets. **The governance line:** verified tenant and unique transaction before drafting; human approval before any customer communication. The former L4 model-based matching proposal is narrowed: an LLM score cannot authorize data access.

3. Features — RICE and MoSCoW

RICE = reach × impact × confidence / person-weeks. Reach uses 02_sizing.xlsx Inputs D6, D14:D20: 6,000 tracing/month, of which 4,500 eligible; 3,600 disputes; 2,400 compliance. Impact, confidence, effort and feature coverage are planning guesses. Sorted scores rank value, not permission to automate.

Candidate feature	Reach/month	Impact	Confidence	Effort weeks	RICE	MoSCoW
Tenant/policy gate + context-only fallback + escalation	12,000	3	80%	2	14,400	MUST
Cited tracing timeline and editable draft	4,500	3	50%	2	3,375	MUST
Categorization and CRM tag suggestions	12,000	0.25	80%	1	2,400	WON'T
Paired timing and grader capture, including fallbacks	4,500	2	80%	3	2,400	MUST
Autonomous merchant replies	6,000	2	50%	4	1,500	WON'T
Dispute deadline drafting	3,600	2	50%	3	1,200	WON'T
KYC/AML hold explanations or release advice	2,400	2	50%	3	800	WON'T
Refund / settlement execution	6,000	1	50%	5	600	WON'T

MUST (3): safe gate/handover; cited tracing draft; paired measurement. **SHOULD:** citation preview usability polish after tests. **COULD:** agent feedback shortcut. These refinements do not expand functional scope. **WON'T (5):** the five rows above; tagging remains manual. Additional boundaries: no customer chatbot, no model training on tickets, no unsupported languages or FX conversion advice. The draft and timing features test the **41.2% time-saving flip assumption** and are MUST despite lower RICE. The hardest cut is dispute drafting: attractive value, but deadline errors are costly and it does not test the dominant assumption.

4. Data

Coursework: synthetic tickets and self-contained ledger snapshots only; 20 proposed cases, AI-generated labels awaiting human approval. No PayFlow exports are present. Future sources: authenticated merchant context, read-only ledger, clearing events and versioned policy; rights, freshness, tenant filtering and retention in governance.md §Session 3. Initial scope: FR/EN/DE, EUR SEPA and USD SWIFT, EU merchants; coverage is qualitative, not representative.

5. Model — smallest rung per component

Part	Rung	Why the rung below fails / why stop here
Auth, tenant filter, exact lookup, freshness, policy blocks	1 — rules	No lower rung; exact invariants must not depend on model confidence
Intent / amount / reference extraction	3 — pretrained model, structured output	Rung 2 needs unavailable human-labelled training data; test reference/keyword rules first and retain them if sufficient
Timeline and reply	4 — hybrid: deterministic join + retrieved facts + pretrained drafting	Rung 3 alone has no current ledger facts or enforceable isolation; compare with rule templates before choosing the LLM
Grounding	4 — exact claim checks + model critique	Rung 3 judge alone cannot enforce exact amounts, tenant identity or citations; rules remain mandatory and critique cannot override a block
Timing, audit and handover	1 — rules	Event capture and routing do not need ML

Choices are hypotheses for S4 ablation, not evaluated superiority. No fine-tuning or dual-model safety guarantee is assumed.

Design loop, prototype and acceptance tasks

3 November 2026 · Desk-based design synthesis. No participant interviews or usability sessions were conducted. This document completes the needs analysis and v2 decision record without attributing decisions to users. It does not satisfy the assignment's requirement for three real conversations and two participant tests.

1. Target users and concrete work situations

Profile	Situation to support	Need	Design response
Tier-1 payment specialist (Karim)	A supplier has not received a payment marked sent to bank	Separate the bank transmission event from confirmed beneficiary credit	Display status and event time beside sources; preserve uncertainty in the reply
Tier-1 covering a colleague's queue	Two €500 payments have the same date and no unique reference	Avoid choosing a transaction from amount alone	Suppress draft; explain missing reference; retain both authorized candidate IDs
Tier-2 payments / compliance specialist	A blocked request arrives after several manual searches	Understand what is known, what is missing and why it was escalated	Handover includes verified merchant, gate, reason, authorized sources and timestamps; sensitive requests name the compliance destination

These profiles are product scenarios derived from S1/S2 and the existing fixtures, not recruited participants. Frequency and reported pain have not been measured.

2. Design findings and decisions

ID	Design finding	Basis	Decision for v2	Acceptance check
D01	One opened ledger record does not establish the clearing event	DEMO-01 has distinct LED-100 and CLE-100 evidence	Require inspection of every displayed source plus explicit review before editor insertion	Opening only one source leaves insertion disabled
D02	"Context only" does not tell the operator what to do next	DEMO-02 has two authorized €500 candidates	Lead with "A unique payment reference is needed"; explain that no candidate can be selected safely	Ambiguous ticket has no draft and names reference request/escalation
D03	A source ID without a retrieval timestamp makes freshness hard to inspect	Spec requires source freshness and preserved handover context	Show fixed snapshot retrieval time in every evidence record and handover packet	Packet retains authorized IDs and snapshot times
D04	A compliance hold requires a different receiving specialist	Compliance requests are explicitly outside tracing scope	Route the sensitive scenario to Tier-2 compliance; other tickets to Tier-2 payments	Packet destination matches scenario
D05	Continuing manually should end the current draft approval path	Manual handling is the fallback at every step	Disable draft insertion after manual handling until ticket reset/reselection	Source/review interactions cannot re-enable insertion in manual mode

3. v1 → v2 decision log

Brief section	v1	v2	Trace
§6 integration	Inspect a source and approve	Inspect every source, approve; edits invalidate review; manual mode disables insertion	D01, D05
§2 fallback	Generic context-only wording	Missing reference explained as the next required action	D02

Brief section	v1	v2	Trace
§6 handover	Source IDs and generic Tier-2 destination	Snapshot timestamps and payments/compliance destination	D03, D04
§3 scope	Three MUST, five WON'T	Same scope; refinements fit inside safe gate, cited draft and handover	D01–D05

4. Two reproducible task scenarios

These are acceptance scenarios, not completed participant tests. No task time, success percentage, hesitation, satisfaction or urgent demand is claimed.

T01 — Grounded tracing reply. Open DEMO-01. Inspect LED-100 only: insertion remains disabled. Inspect CLE-100, read that beneficiary credit is not confirmed, and explicitly review. Insert the draft; the editor contains the cited reply and no message is sent. Edit the draft: review resets. Switch tickets: inspection and approval reset; an unvisited ticket has an empty editor, while revisiting restores only its own text. An existing different reply requires explicit replacement confirmation.

T02 — Ambiguity and specialist handover. Open DEMO-02. Confirm that a unique reference is needed and no draft is available. Choose "Ambiguous transaction", add safe context and escalate. The preview names Tier-2 payments, the merchant, reason, both authorized sources and their snapshot times. Open DEMO-03 and use the sensitive-request reason: destination is Tier-2 compliance. DEMO-04 has no transaction sources or foreign owner details.

5. What the users changed / could not decide

User-driven changes: none established. D01–D05 are team design decisions. They improve the v2 surface but do not establish desirability. The original brief is retained for comparison.

Users cannot determine the economic hurdle (CFO/Product), measured savings and quality (paired timing and independent graders), model choice (Engineering evaluation), legal basis and retention (DPO/Legal), or scope approval (Ops/CCO). The 41.2% threshold remains fixed.

6. Decision

Proceed with the S4 implementation under a conditional design GO. Desirability is unvalidated. Technical, economic and production gates remain separate; no enthusiasm, completed interview or human label approval is asserted. Participant research is excluded by the team's current decision, so its assignment requirement remains unmet.

Prototype and original prompt

Public link: https://deploy-project-product-management.vercel.app. Last source-recorded HTTP verification: 3 November; no new availability or rendering claim. Local prototype/index.html needs no installation or API key. Runtime is deterministic with synthetic fixtures, not connected to Zendesk, banks or a model.

Tool / time box: Codex-assisted HTML/CSS/JS. Initial build duration was not instrumented; under-one-hour compliance is unproven. Later versions add local workflow features, not completed participant tests.

— the brief in three paragraphs

Paragraph 1 — user and job:
Build a local clickable FlowAssist prototype for Karim, a Tier-1 PayFlow B2B payment operations specialist. Place it in an internal Zendesk-like inbox. He investigates a merchant's missing payment, checks transaction evidence, reviews a cited reply, and either places it in his human editor or escalates. Use fictional tickets and records only. This is a scripted S3 research surface, not a live bank or LLM implementation.

Paragraph 2 — screen and controls:
Show an assigned-ticket list, original message and human reply editor, plus a payment investigation sidebar with verified merchant, transaction, source IDs and timestamps, editable draft and source detail. Require source inspection and explicit review before Use draft in editor. Invalidate review after a draft edit and clear state on ticket selection. Add a handover reason, safe agent note, Escalate with context, Continue manually and Reset test. Show the handover packet locally. Make the page responsive, keyboard usable and explicit that no message is sent.

Paragraph 3 — routing and trust:
Include one grounded tracing example, an ambiguous two-candidate payment, a compliance-hold request and a denied foreign reference. Keep drafts suppressed for blocked cases and show no unauthorized source details. Explain context-only versus human-only in plain language. Retrieval candidates are L3, drafts L2, customer send person-only; no refunds, hold release, ledger writes or autonomous replies. Use synthetic data, no API calls, external assets or persistence. Keep all interactions local and label every simulation.

Spec skeleton and measurement plan

User, trigger and scope

Karim receives an assigned merchant ticket. Confirm identity and intent; retrieve authorised read-only ledger/clearing evidence; confirm a unique transaction; draft only eligible tracing; inspect all sources; human reviews/edits/sends. Always allow manual handling or safe specialist handover. Disputes, KYC/AML, refunds and autonomous sending remain out of scope.

Input / output contract

Input: ticket ID/text/language, authenticated merchant and assigned specialist, source IDs/timestamps, transaction reference, amount in integer minor units, currency and policy version. Extracted entities are untrusted hints; no model SQL. Output: draft_ready | context_only | human_only, cited draft or null, authorised evidence, block reason and specialist route. No customer-send or financial-write tool exists.

Deterministic gates and state

Verify assigned-agent access and tenant before retrieval. Unique reference, currency, amount/gross-net reconciliation and source identity must agree; amount alone never authorises. Missing/stale/contradictory evidence, malformed output, timeout or sensitive intent suppresses drafts. Provisional freshness ≤5 min, retrieval ≤2s and total pipeline ≤10s require validation. A model score cannot override rules.

loading → draft_ready | context_only | human_only. Insertion requires all sources inspected and explicit approval. Edits invalidate approval; ticket changes reset inspection/review. Manual mode disables insertion; resuming requires fresh review. Handover preserves authorised IDs, timestamps, reason and notes; compliance goes to Tier-2 compliance, tracing to Tier-2 payments. Session restoration never restores approvals. Local receipts and audit are editable browser state, not authenticated production records.

Edge cases and fallback

No/multiple match → request unique reference; foreign/forged tenant → empty context and block; unexplained currency/gross-net mismatch → context only; stale/conflicting feed or timeout → suppress; unsupported language, dispute, fraud or KYC → person; injection cannot change scope; credentials/IBAN are redacted, failed redaction routes manually. Never turn “sent to bank” into “beneficiary credited” or invent an ETA, deadline, refund or hold-release advice.

Done criterion and denominator

Use the one-sentence success criterion in brief v2: frozen 200 synthetic tracing cases, eligibility labelled before execution, ≥41.2% total active-time saving including review and fallback; QA ≥92%, unsafe-draft flag precision ≥98%, zero critical exposures. Saving = 1 − sum(assisted active time) / sum(manual active time) over all pre-labelled eligible cases; failures stay in the denominator. Randomise/counterbalance paired timing; report raw intervals, agent count and uncertainty. Do not replace measured manual time by the 18-minute assumption.

Two independent graders check tenant/transaction, money/status/time, citations, safe action and wording. QA rubric: factual accuracy 40, source coverage 25, policy safety 25, clarity 10; critical failure overrides score. Grounding precision = unsafe flags confirmed unsafe / all unsafe flags; also report recall and false-safe count. No flags means undefined precision. Disagreement remains fail/pending adjudication.

Seed origin and freeze

The 20 inputs and initial labels are AI-generated and not human-approved. Two real reviewers must independently check every label/reference and reconcile before freezing a commit and policy version. Keep development/demo cases separate from held-out evaluation, deduplicate by scenario family. Expand to 50 for A4, then 200 tracing cases. The seed does not prove performance or represent the production mix. Seven cases are proposed timing-eligible; thirteen exercise blocking/handover.

Data audit and governance

Six-question data audit

#	Question	Answer for S3 and proposed live system	Source type	To check with
1	Provenance	20 AI-generated synthetic inputs, explicit fictional ledger snapshots and policy fixtures, created 2 Nov 2026. No actual customer data. Future ticket/ledger/clearing records need system owner, collection timestamp and lineage per record.	Repository inspection; future access is a guess	Data Engineering + Ops
2	Volume & labels	20 seed rows, expected actions proposed by AI and **not yet human-labelled**. Two team members must independently check labels and references before freeze. The 144k historical tickets in S1/S2 are unavailable.	Counted seed rows; scenario volume	Ops QA + independent team reviewers
3	Coverage	Seed covers EN/FR/DE plus unsupported PT; EUR SEPA, USD SWIFT; SMB/ Enterprise; routine, ambiguous and critical cases. Plans/regions are explicit row metadata; population shares are unknown. No claim of representative segment performance.	Synthetic design choices	Ops + language reviewers
4	Rights	Synthetic coursework has no customer-data rights grant. Future processing needs purpose, controller/ processor mapping, DPA, provider no-training/ retention terms and approved transfers. Art. 6(1)(b) applies only where necessary for a contract with the data subject; a B2B corporate contract alone does not establish this for every contact/ counterparty. Assess Art. 6(1)(f) necessity/balancing where appropriate; no assumed approval.	Proposed legal interpretation, validation pending	DPO / Legal

#	Question	Answer for S3 and proposed live system	Source type	To check with
5	Leakage	No ticket reuse across tenants. Backend session supplies merchant ID; access check and row-level filter occur **before retrieval**. Cache keys include tenant and scope; prompts, citations and logs retain this boundary. Negative tests include foreign reference and forged tenant instruction. Split evaluation from prompt development by scenario family and near-duplicate check.	Design; not implemented security evidence	CISO + Engineering
6	Freshness	Each snapshot carries event/fetch time and version; provisional maximum age 5 min. Missing/stale/conflicting data suppresses draft. Version policy fixtures and rerun after changes. Production freshness/SLA must be agreed with clearing owners.	Guess to test; fixture timestamps explicit	Clearing owner + Ops

Purpose, minimisation and retention

Purpose: answer an assigned merchant's payment-tracing ticket with evidence and human approval. No training, marketing, employee scoring or unrelated profiling. GDPR Article 5 requires purpose limitation, data minimisation and storage limitation; proposed durations below are design choices, not statutory periods. GDPR Articles 5–6.

Artifact	Proposed retention / control	Owner
Synthetic fixtures and code	Course repository lifecycle; no personal payment data	Team
Interview notes	Anonymised, only with permission; delete within 30 days after final assessment; no raw audio by default	Research lead
Live retrieval context	Request memory only, clear at completion; no shared raw-result cache in MVP	Engineering
Raw prompts / model replies	Do not persist by default; redact secrets and personal identifiers before API use	Engineering + DPO
Minimized live audit metadata	Proposed 90 days; ticket ID, actor, policy/ model/source versions, gate reasons, approval event; restricted append-only store	Ops + CISO, DPO approval
Original support / financial records	Existing separately approved source-system schedule; no new full ledger copy	System owner + Legal

No real-data call until provider terms, retention controls, sub-processors, hosting/transfers, and access paths have been checked. Full PAN, credentials and unmasked banking identifiers are excluded. Anonymisation claims require re-identification assessment; masking alone is not anonymisation.

Customer isolation and known gaps

Server-side assigned-agent authorization → tenant-constrained parameterized query → authorized source set → redaction → model prompt. Recheck tenant and transaction identity on citations and draft insertion. Index namespace and any cache key include `merchant_id`; no global historical-ticket search. Failed auth returns empty context and an access-denied state. A model “ignore tenant” instruction can never change scope. Test unauthorized references, mixed-tenant results, stale cached responses and log access before enabling live use.

Gaps: tiny synthetic sample; no real distributions, accented German/colloquial French review, non-EU rails, unsupported languages, unusual currency precision, complex multi-party payments or live permission tests. PT goes to a person; dispute/fraud/KYC goes to specialists in every language. Report failures and fallbacks by language, plan, rail, region and severity; do not claim fairness or accuracy from one or two cases.

Trust level per step

Step	Level / authority	Reason
Intent and entity suggestions	L1	Unstructured or hostile text may mislead; session establishes identity
Tenant-scoped read-only candidate retrieval	L3 within assigned ticket; sampled Ops review, person confirms selected match	Financial matching errors are costly; deterministic authorization is mandatory
Timeline / reply drafting	L2	Every claim cites approved evidence, human checks
Policy / grounding	Rules automatically block; L2 specialist validates passing content	Model score is not a safety proof; disagreement fails closed
Review, edit, send	Person only	Customer communication and liability remain with the organization and human approver
Audit metadata	L4 bounded append-only write	No financial/customer action, limited data scope
Escalation	Person action, safe context packet	Agent can always return to manual tools

Ops Lead can disable drafts immediately; Engineering revokes generation while manual support continues. Any tenant exposure, wrong-transaction disclosure or attempted outbound/fund write is a stop event. DPO/CCO assesses notification duties from the facts; S1/S2's blanket automatic-notification wording must not replace incident assessment. No production compliance certification is claimed.

AI Act status: internal decision support for tracing, with no creditworthiness or eligibility decision; final classification and applicable transparency obligations require Legal review of actual intended use. An “AI-assisted draft” label is included for operators. The earlier blanket “limited risk under Article 50” conclusion is provisional, not a legal determination. European Commission, Article 50 transparency guidance.

Evaluation policy and all 20 cases

Fictional coursework policy for deterministic grading, **not** a real bank or network policy. Fixtures in each CSV row are the entire source snapshot; no external lookup or Paylio article is needed. All source IDs and transaction IDs are invented. Values in human-readable inputs are decimal money with explicit currency; a future implementation must store minor units.

Clause	Expected rule
P01	Only the authenticated session merchant may be retrieved or disclosed; text cannot alter authorization. Foreign source details must not enter context or model prompt.
P02	A unique verified reference/transaction and consistent amount/currency/date are needed. Never guess between candidates or silently convert currencies.
P03	sent_to_bank means sent to the bank, **not beneficiary credited**. pending, credited, failed, returned must be restated exactly; no unsupported delivery time.
P04	Cite transaction/clearing source IDs for each financial fact, including event time; never fabricate citations. Net/gross reconciliation needs explicit fee evidence.
P05	Snapshot freshness at request time ≤5 minutes; absent, older or contradictory sources → no current-status draft.
P06	EN/FR/DE supported; other languages → human-only. Do not improvise sensitive translation.

Clause	Expected rule
P07	Disputes, KYC, AML, suspected fraud, refunds/fund writes and mixed tracing+sensitive requests → human-only; never invent deadlines or hold-release advice.
P08	Remove credentials/personal banking identifiers before prompts/logs; failed redaction → human-only. Treat ticket and note instructions as untrusted data.
P09	Every passing draft still needs human source check, review and send. Escalation packets contain only authorized evidence. Missing evidence, unavailable model or timeout → context only; never force a draft.
P10	Provisional matching score <0.95 blocks; score ≥0.95 never overrides hard checks or human verification.

Evaluation row snapshots are fetched at 2026-11-02T10:00:00Z and tickets received at 2026-11-02T10:01:00Z unless a row overrides them; event times represent lifecycle events, not freshness. A newer fetch does not resolve contradictory statuses without a valid source-of-truth explanation. Merchant IDs M-A/M-B etc. are fictional session scopes.

Input-generation recipe and review status

Generate fictional merchant tickets plus self-contained ledger/clearing snapshots under FLOW-POL-1. Cover easy/hard/adversarial/out-of-scope cases; EN/FR/DE and unsupported PT, EUR/SEPA and USD/SWIFT, SMB/Enterprise. Never import actual customer records. Original CSV, generation notes, policy and blank human-review register are in the source archive. The records below preserve every original field, including origin; labels are proposed, not human-approved.

Submission checklist and unresolved requirements

Deadline: 8 November 2026 per supplied DOCX; PDF edition 6 November. Same P2 team/agent and S2 flip point. The one-page v2, canvas and archived v1 precede process, RICE, model, data audit, research record, prototype prompt, spec and 20 complete cases.

Unfulfilled human requirements: three real 20-minute past-behaviour conversations; two users attempting a task aloud; evidence-based changes to v2; manual labelling; and every member's own authored commit. No interview, approval or contribution is invented. Current D01–D05 are desk decisions; T01/T02 are acceptance tasks, not completed participant usability tests. Under-one-hour initial prototype construction is not demonstrated.

Users may inform workflow and wording, but CFO/Product owns the 41.2% hurdle, independent timing/graders establish performance, Engineering evaluates model choices, DPO/Legal approves processing/retention and CCO/Ops approves scope. A tracing-only success does not validate S2's dispute/compliance or strategic value.

Original formats: Sources/Assignment_3_sources.zip retains all required Markdown, original v1, CSV, policy, blank human review register and clickable prototype. The PDF condenses their presentation; it does not replace the repository or establish full assignment compliance. Live identity, bank/Zendesk access, model-based evaluation, causal time savings and production readiness are not demonstrated.
